The fusion proteins can be used for diagnosing, preventing, or treating cancer, such as prostate cancer. The prostate specific proteins were isolated from a human prostate tumor cDNA library. The present sequence is one such cDNA clone which was isolated in the prostate-specific CDNA library. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at sequata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New fusion protein comprising a P501S polypeptide and an unrelated fu partner, useful for diagnosing, preventing, or treating cancer, such prostate cancer.

alleles. ADB1363 is a polypeptide encoded by a human prostate specific

cond, one of 648 disclosed as may. Also included are nucleic acids

conding the proteins and peptides, expression vectors, a host cell

cransformed with the vector, an isolated antibody (or antigen binding

cransformed with the vector, an isolated antibody (or antigen binding

crample with a petifically binds to the protein or peptide, detecting

the presence of a cancer in a patient (comprising contracting a patient

cample with a binding agent that binds to the peptides or a polypeptide

comprising the peptides or proteins to polypeptide that binds to

comprising the peptides or proteins stimulating or expanding T cells

septides or the isolated T cell population, treating prostate cancer in

comprising the peptides or proteins stimulating or expanding T cells

specific for a tumour protein comprising contacting T cells with the

comprising the peptides or compounds, determining the presence of

cancer in a patient and treating a composition comprising the peptides or that the Peptides or antigen presence of the peptides or antigen presence of an election comprising the

concer in a patient with the peptides or antigen presenting calls that express

cracer in a patient with the peptides or antigen presenting calls and election comprised or antigen. The peptides or antigen present of differentiation (CD4+) and/or CD8+ T cells isolated

from a patient with the peptides or antigen presenting calls antigen. The peptides, are used to cancer in a patient. The peptides, or an oligonucleoride

cracer in a patient and are used to estimulate or expand T cells specific for a tumour protein. The peptides, are used to simulate or expand T cells specific for a tumour protein. The peptides, secundate cancer in a patient. The present sequence is a 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GGGAACAATGGCTGAGCATATAACCATAGG---TATGGGAACAAAAACATCAAAGTCAC 1111

(I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate calc cancer in a patient; (f) assessing the prostate calc cancer in a patient; (f) assessing the prostate calc arcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker

(MILL-) MILLENNIUM PREDICTIVE MEDICINE INC.

Monahan JE Endege WO, Schlegel R,

WPI; 2001-662795/76

Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.

Claim 1; Page 3587; 11750pp; English

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate calc in in a patient; (f) assessing the prostate cancer in a patient; determining whether prostate cancer has metastasized in a patient; (d) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker

Sequence 1481 BP; 364 A; 346 C; 314 G; 453 T; 0 U; 4 Other;

Gaps 4 ; Length 1481; Indels Score 599.2; DB 5; Pred. No. 2e-184; 0; Mismatches 9; Query Match 92.8%; Best Local Similarity 98.0%; Matches 628; Conservative

Sequence 311, Application US/09232149A

Patent No. 646511

GENERAL INFORMATION:
APPLICANT: Xu, Jiangchun
APPLICANT: Dillon, Davin C.
APPLICANT: Mitcham, Jennifer Lynn
ITLE OF INVENTION: COMPOUNDS FOR IMMUNOTHERAPY OF PROSTATE
ITLE OF INVENTION: CANCER AND METHODS FOR THEIR USE
FILE REFERENCE: 210121.427C6
CURRENT APPLICATION NUMBER: US/09/232,149A

CURRENT FILING DATE: 1999-01-15
NUMBER OF SEQ ID NOS: 338

SOFTWARE PRESERVE FASTERO FOR Windows Version 3.0
